

# Parker Mountain Community Wind Project

## Project Information - April 2013

### NOTE-Meeting Announcement

Scotian Wind will host a public open house at the Annapolis Royal Fire Hall on Wednesday April 24. Please drop by between 6pm and 8pm to see informational displays and talk to the professionals from Scotian Wind about the Parker Mountain Project.

### About the Project

Scotian Wind Inc has proposed to install a single wind turbine on Parker Mountain. The proposed project would be located about 1.5 kilometers southwest of Parker's Cove. Scotian Wind Inc is in the process of preparing the site for installation and expects to erect the turbine later in 2013. Our third party environmental auditor, Strum Environmental has completed the Environmental Impact Statement and related studies. These studies along with wind data collected from the meteorological tower allow us to site the turbine appropriately.

The capacity of the turbine we expect to put on site just under 2 Megawatts, representing enough energy to power 500 to 600 households. The tower for this turbine is projected to be approximately 100 meters high, with each blade measuring about 50 meters in length.

### Community Electricity

The provincial government has established clear targets for clean energy: 25% of our electricity is to be renewable by 2015, with a goal of 40% by 2020. The renewable energy targets are part of the larger provincial initiative set out in legislation called the Environmental Goals and Sustainable Prosperity Act (EGSPA). EGSPA sets out targets to help Nova Scotia become "one of the most environmentally and economically sustainable places in the world by 2020".

The provincial government recognizes that small community-owned projects are an effective way to reach our goals in a manner that maximizes benefits for all Nova Scotians. Their vision will shift ownership from the virtual monopoly currently held by Nova Scotia Power to a decentralized structure that would see many

small groups owning our electricity sources. All of the electricity produced by the turbine at Parker Mountain will be consumed at the local level; only the people who are connected to the same electrical substation as the turbine can use its power.

### A Global Trend

Wind energy is cited by the International Energy Agency as the world's fastest growing energy resource. Worldwide, the combined capacity of all wind turbines is over 195 GW; the equivalent of 100,000 of the turbines Scotian Wind proposes installing in your community. In Nova Scotia, there are already over 100 of these turbines installed throughout the province. Communities across Nova Scotia are taking responsibility for the generation of their energy and enjoying the benefits that come with local electricity production.

### Nearest Turbine

The nearest large wind turbines to Parker Mountain are an hours' drive away at the Digby Neck Wind Farm, near Gulliver's Cove. These turbines are about the same height and size as the turbines that Scotian Wind intends to install in Parker Mountain, and have been in operation since 2010.

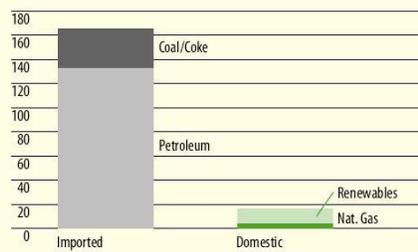

Visiting a turbine is a great way to get a sense of the sound and scale of today's utility-scale wind turbines.

## Energy Security

Wind energy is a safe, locally produced source of energy that will lessen our dependence on foreign sources of fuel. Once a wind turbine is installed, it produces electricity without the need for costly fuels. After a few short months, the turbine has generated as much electricity as it takes to build, install, and decommission it.

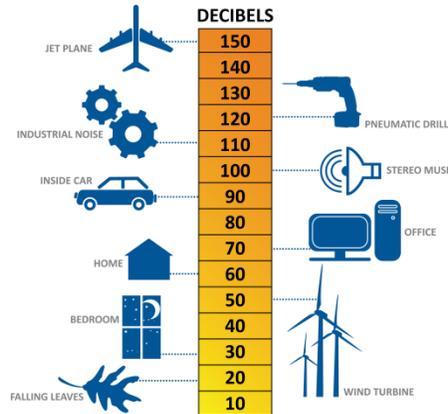

As the figure on the right shows, the amount of energy that our province imports vastly outweighs the amount of energy that we produce. Every shipment of coal or oil that is unloaded in Nova Scotia is effectively an exportation of money out of the province. With the price of oil and coal expected to keep rising with each passing year, electricity costs are expected to rise accordingly as shown in the figure on the right. By contrast, wind power offers Nova Scotians a way of ensuring that their electricity bills won't be tied to the price of oil, while promising to keep more of our energy dollars within the province.

## Sound

Over the past 30 years, over 60,000 wind turbines have been installed around the world. During that time, new technologies have allowed the sound produced by industrial turbines to decrease year by year. Each turbine must meet strict environmental requirements, including minimum setbacks from nearby homes that limit the possibility of noise pollution. Thousands of people have been living near large wind turbines for decades, with a relatively small number of those people experiencing negative effects. As a result, a large amount of peer-reviewed studies have focused on the impacts of wind turbines on human health. In 2009, after reviewing all the available literature to date, Ontario's Chief Medical Examiner concluded that though some people find the sound of wind turbines "annoying", she could find "no conclusive evidence that turbines have an effect on health." Scotian Wind is committed to ensuring that none of our projects have a negative impact on the health of those who live nearby. The figure above shows how the sound from a wind turbine compares to various other everyday noises.

## Community Benefits

One of the questions we are most often asked is how does a turbine installation in my community benefit me. We all understand how replacing dirty fossil fuels with clean renewable energy benefits the world, but seeing the benefit of a turbine near our own home is a little complex.

First of all, 100 percent of the energy produced by our projects is consumed locally. More sources of power distributed throughout our province is better for the grid. Locally produced power means less reliance on foreign owned sources and stabilizes the price you pay for electricity. Children see their own community caring about \*their\* future. Energy responsibility is an important lesson for building a better future. Scotian Wind is a Community Economic Development Corporation (CEDC). It is owned by local investors and that means more money in the pockets of people in communities around Nova Scotia and a boost to local economies.

And finally, Scotian Wind is putting money into the communities that host our projects. 1% of revenue from each turbine will be reinvested into community projects as chosen by the community. We estimate that will mean approximately \$8,000 toward community projects in the Parker Mountain area each year.

## Climate Change

Climate change is happening at an ever increasing rate, and it will seriously affect the lives of people around the world. During the twentieth century the sea level in Nova Scotia rose approximately 30 centimeters. Researchers expect an additional increase from 70 to 140 cm over the next century. Nova Scotia is particularly sensitive to coastal impacts. Combining the relative rise in sea level with more intense storms means that storm surges will be larger. This means more damage to people, property, infrastructure, wildlife, and ecosystems along the province's 13,300 kilometers of coastline.
